Score Sheet for P.I. Visual Orientation Test

- 1) See correct answers annotated on attached prints and mosaic.
- 2) Score 1 point for each correct picture-taking point and each correct leg of the visual angle.
- 3) Best possible score is 9; give a superpotail of 10 for very accurate work.
- 4) Preliminary try-outs of this test indicate that less than 7 points means some difficulty and 5 or less is trouble. The two principal faults seem to be carelessness (slap-dash conclusions) and total blocking due to inexperience. The third problem is hardest, involving closest observation and perception of bridge under construction. It is of interest that there are two different routes to the solution of this problem, one by judging the river curves, the other by close study of buildings. The method chosen may correspond to a basic difference in perception methods. Persons who get 5 points on the first two tests and block up completely on this one should be given some help and allowed time to study it out.
